

ARCAPAQ

Pneumatic Diaphragm Actuator

with unique reliability

ARCA
VALVES

The new, pneumatically operated multi-spring diaphragm actuator, Type ARCAPAQ, series 812, is the result of our more than 75 years of experience in the development, production, maintenance, and repair of complete high-quality control valves for the most versatile industrial applications.

Design Features:

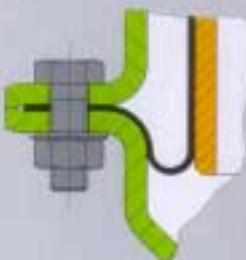

- **Rolling diaphragm design**, proven in thousands of the most versatile industrial applications.
- **Direction of action easily reversible**, even on site, without special tools and without dismantling the actuator.
- **Low volume** between diaphragm and housing.
- **Integrated air-supply** and **Waste air scavenging** of the spring chamber, as an option on request.
- **Compact design** with reduced height.
- **The specially shaped spindle-coupling** is also used as stroke indicator, and is safeguarded (conforming to UV).
- Versatile **selection of actuating power** by variable number and type of the helical springs.
- Splash-proof **special de-aerator**.
- Solid yoke made of spheroidal graphite iron, **conforming to NAMUR**-standard.
- Extensive material selection.
- Pressure-loaded housing parts and springs completely **protected against corrosion**.

Your Advantages:

- High reliability and power with high positioning speed and negligibly low friction.
- Simple handling and low costs for stock-keeping.
- Short reaction time.
- Unique safety of operation.
- Reduced space requirement makes it possible to install ARCAPAQ-valves also in plants with limited space, maintaining their easy maintenance.
- Protection against accidents.
- Individual adaption to requirements.
- Mounting in any position.
- Universal modes for the installation of additional equipment.
- Wide field of application.
- Long service life.

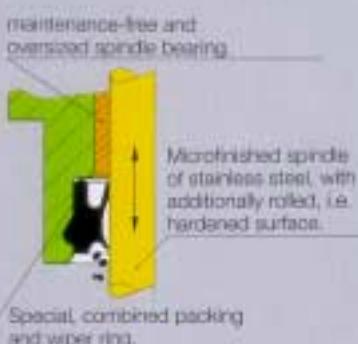

The innovative ARCAPAQ design

Diaphragm clamping

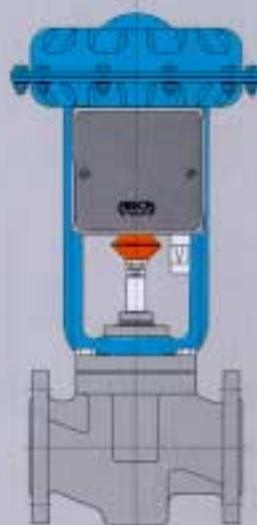

Definit pressing (clamping) of the proven diaphragm in the power-bypass mode.
High availability by defined motion of diaphragm.

Spindle bearing and sealing

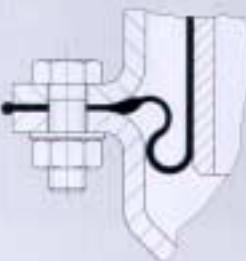

Durable and maintenance-free, even in dusty and dirty environment. Wearing particles are wiped off before they reach gasket or bearing, thus avoiding friction of wearing particles between spindle and bearing.

Compact design with unique safety of operation, e.g. by integrated air supply. Accessories (limit switches, solenoid valve etc.) mounted in the positioner.

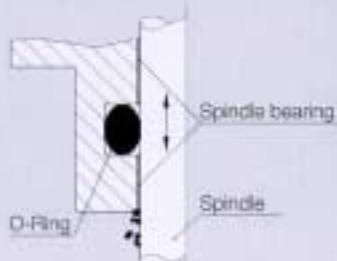

The usual design

Diaphragm clamping

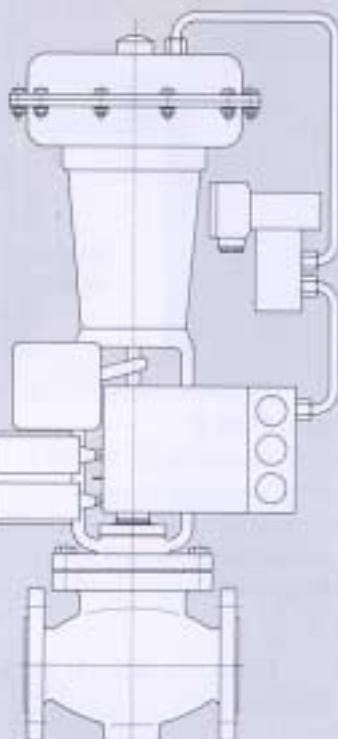

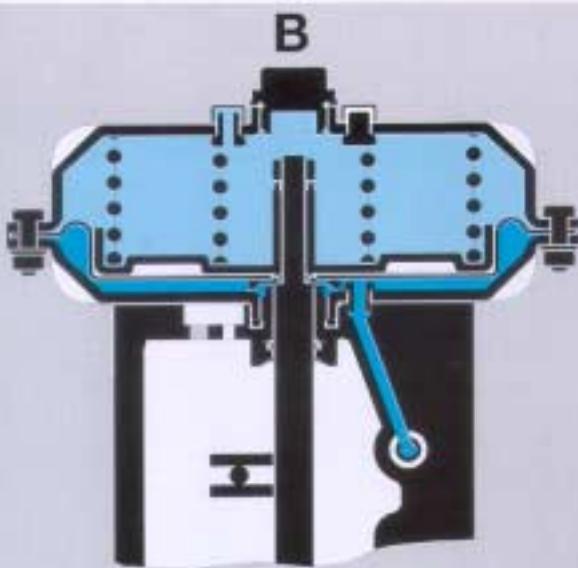

Risk of uncontrolled pressing of diaphragm and of creases. Reduced lifetime of diaphragm by uncontrolled motion and flexing work.

Spindle bearing and packing

O-Ring seal, basically suitable for static load. Sensitive against dirt. Possible transport of wearing particles between bearing and spindle with resulting damage to sealing surface (leakage).

**Execution B**

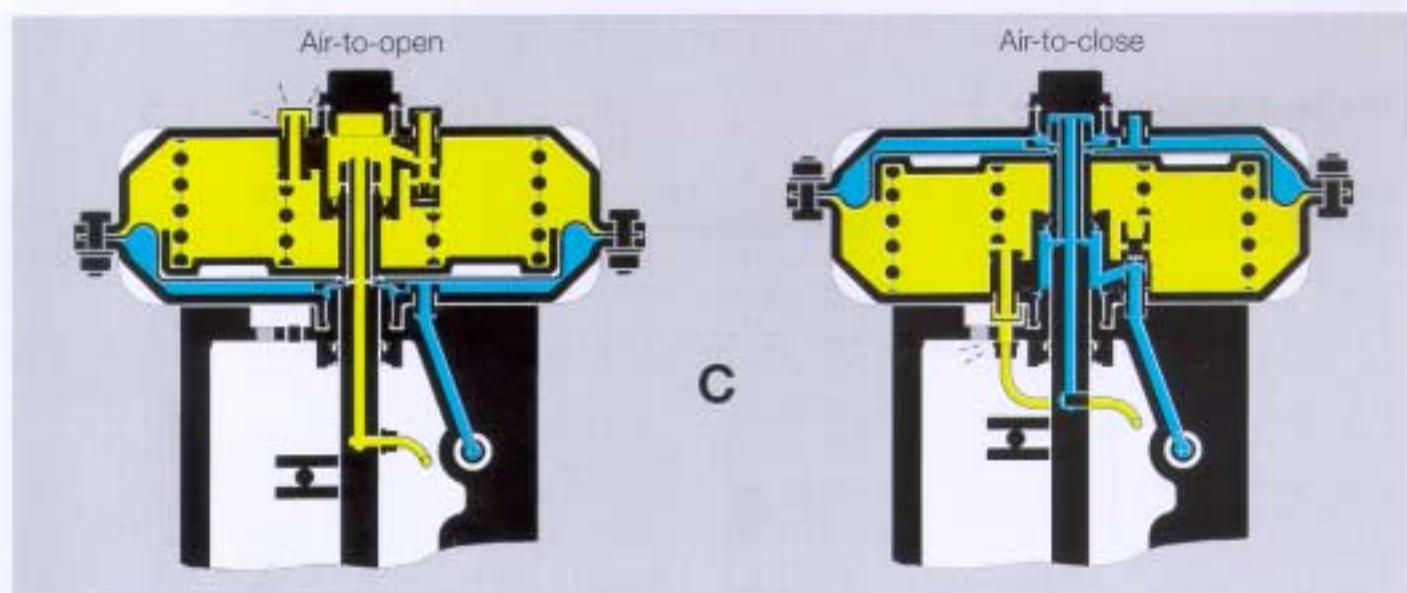

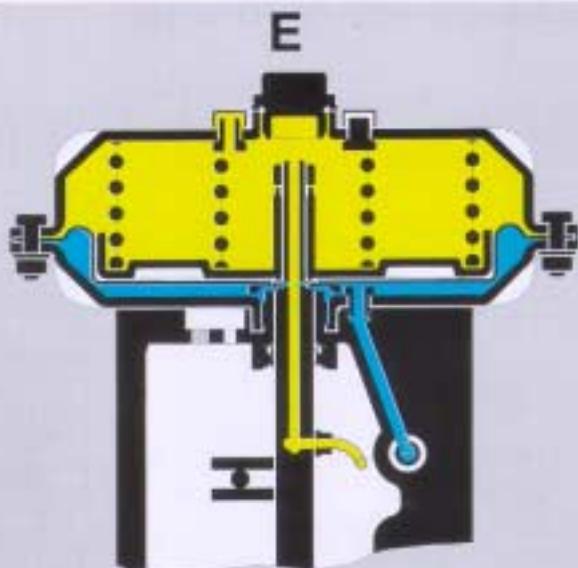

- Reversible without dismantling the housing
- air-to-open: without external piping
air-to-close: with external piping
- integrated mounting of valve positioner
- spraywater-proof,
- corrosion-resistant

Options:

● transport eye-bolt

Execution E

- E = B + air scavenging system
- spring chamber protected by exhaust air scavenging.*

**Execution C**

- Fully reversible, by means of air reversing sleeve
- air-to-open and air-to-close actions without external piping
- integrated mounting of valve positioner

- spraywater-proof,
- corrosion-resistant
- spring chamber protected by exhaust air scavenging*

Options:

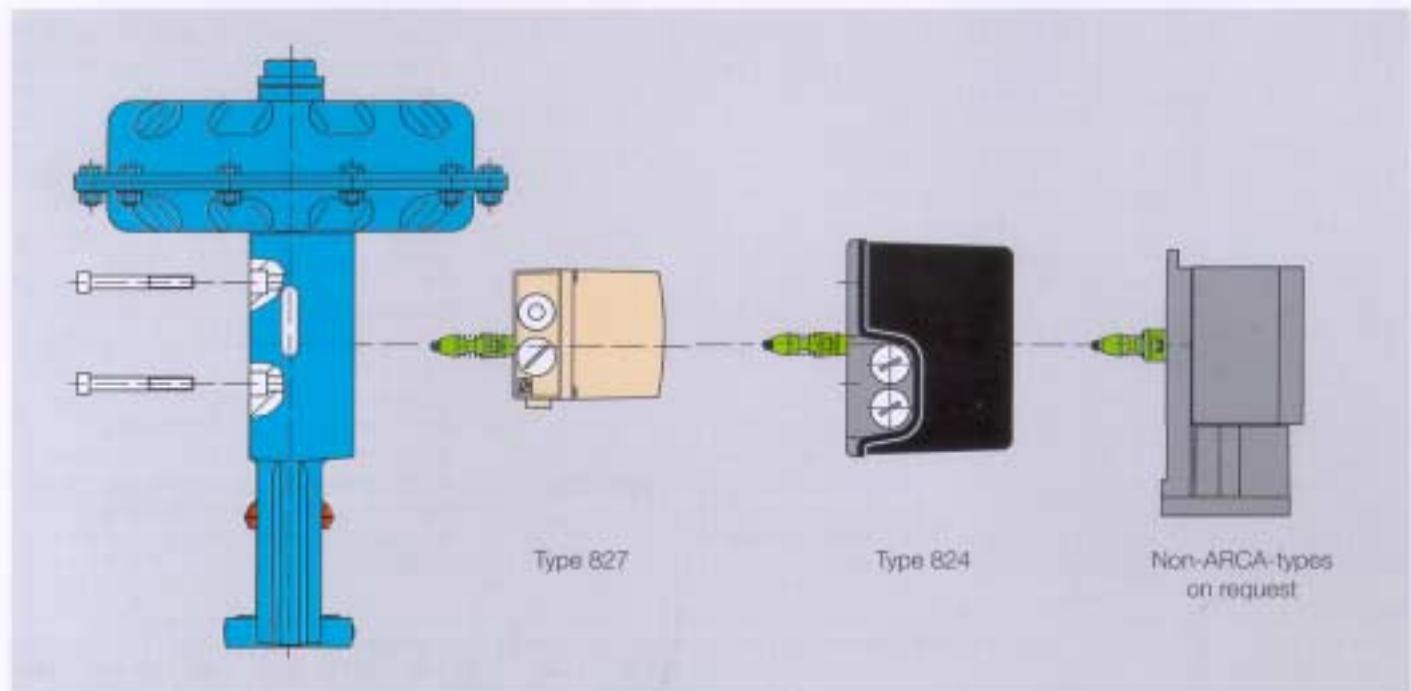

● transport eye-bolt

● stroke limitation ● stainless steel diaphragm chamber (see Type 813)

Simple Plug-on-Principle encased and with air scavenging

Mounting of Valve Positioner

The valve positioner can easily be mounted in the simple plug-on mode by which the air supply connection and the stroke pick-up are realised simultaneously.

Encased ARCAPLUG stroke pick-up

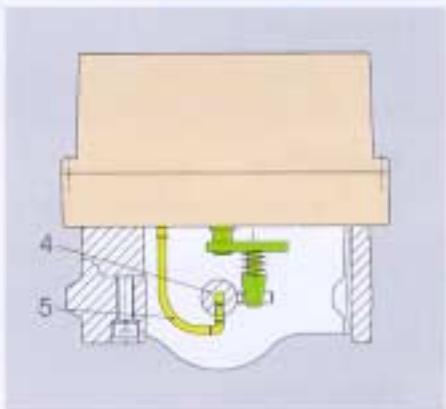

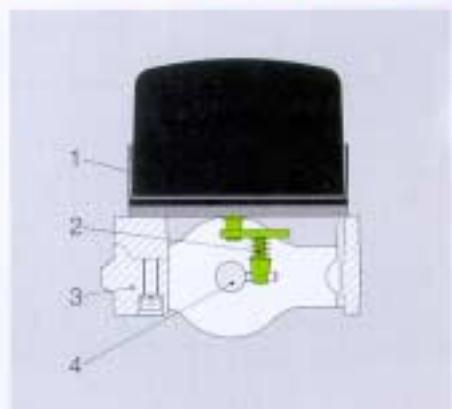

Left:

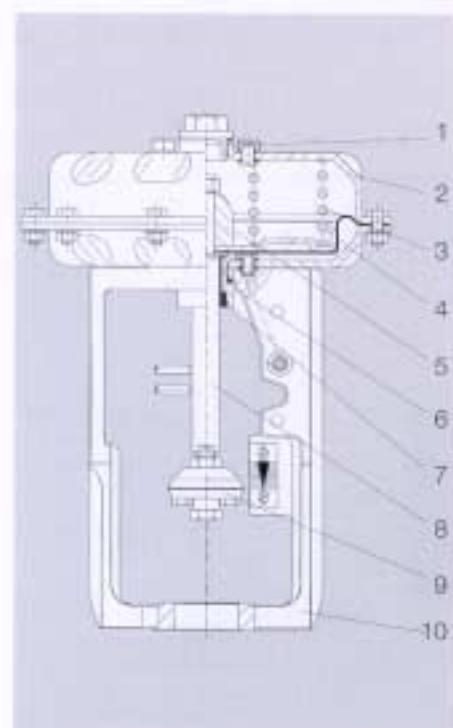

The elements for the stroke pick-up (2) of the positioner (1) are protected within the yoke (3) of the actuator. A self-adjusting tapered roller „ARCAPLUG“ provides for a stroke transmission of the actuator spindle (4) without any backlash. The picture on the left shows the actuator size MF III with standard torsion lock.

Right:

Mounting of smart positioner type 827 on actuator type 812 execution C (ATO) and execution E. The positioner exhaust air is conducted in the actuator spindle (4) through a high flexible pipe (5) and from there gets into the spring chamber of the actuator. The cleaned and dried positioner exhaust air takes care for that damages caused by humidity, which till now could occur in the spring chamber, are avoided to the greatest possible extent.

- 1 Splash-proof protective cap
- 2 Actuator housing
- 3 Spring
- 4 Diaphragm
- 5 Diaphragm plate
- 6 Slide bearing
- 7 Special sealing cum wiper ring
- 8 Actuator spindle
- 9 Stroke indicator
- 10 Yoke

Description of function

The ARCAPAQ actuator is designed for the operation of control valves with a linear stroke. The actuator spindle (8) is connected to the valve-spindle by means of coupling device (9) which also serves as a stroke indicator. The spindle is guided in a solid slide bearing (6) and sealed by a special packing-cum-wiper ring (7). The diaphragm (4), supported by the diaphragm plate (5) and connected to the actuator spindle (8), divides the actuator housing (2) into a pressure chamber and a spring chamber. If the force of the air pressure surpasses the force of the springs, the actuator spindle (8) is moved and operates the control valve. The air supply is realised through internal channels in the yoke (10). The ventilation of the spring chamber is achieved by means of the spraywater-proof protective cap (1). Alternatively, the spring chamber is scavenged by the waste air of the positioner.

Operational safety and environmental protection

The combination ARCAPAQ and ARCASAFE bellows valve guarantees safety by high availability and total sealing to the outside. Thus it is an effective and economic contribution for the protection of mankind, environment and product.

Quality acc. to DIN/ISO 9001

Since many years we are producing acc. to a proven quality-securig-system, to grant a constant product quality with agreed characteristics. The certification of our QS-System acc. to DIN/ISO 9001 resp. EN 29001 was accredited by the Germanic Lloyd, as a neutral institution,

Quantity production and modular parts system

The ARCA modular parts system offers a surpassing multitude of standard valves and saves your money. An economical quantity production and a modern overhead shelf stock permit short delivery times and a high quantity of standard varieties.

We reserve the right of technical alterations.
